OVERVIEW

Software engineer with over a decade of experience across operating systems, compilers, and financial systems. Active contributor to the FreeBSD Project. Excels when close to the metal, and codes in C, C++, Rust, Go, Swift, Forth, Lua, POSIX shell, AWK, SQL, and JavaScript, with working knowledge of several others. Values correctness, security, and standards conformance — e.g. ISO C, CERT, MISRA, POSIX, and SUS.

PROJECTS

FreeBSD Project

Src Committer

open source

Aug. 2026–Present

Focused on ISO/IEC 9899 (C) and POSIX standards conformance across libc and the base system, with contributions to VIRTIO.

EMPLOYMENT HISTORY

OMPFInex

Software Engineer

full-time

Nov. 2023–Present

- Built and maintained a secure and fully fledged Identity and Access Management (IAM) system.
- Developed a multi-channel notification platform supporting mobile and web push, email, and SMS through either topic-based fan-out or direct delivery.
- Refactored and maintained customer club and the gamified rewards and loyalty platform.
- Contributed across trading, settlement, and custody — matching engine, market making, order management, trade settlement, ledger and accounting, wallet infrastructure, deposit and withdrawal pipelines, and market data feed.
- Mentored engineers, conducted code reviews and technical interviews, and contributed to hiring and onboarding.

illuria Security

Software Engineer

full-time

Jan. 2022–Jun. 2023

- Led the infrastructure and release-engineering teams, architecting reproducible, zero-trust deployment systems for customer environments.
- Engineered an automated FreeBSD distribution build and delivery pipeline.
- Wrote low-level DTrace instrumentation to profile attacker behaviour on the deception platform.
- Developed several performance-monitoring and system utilities.
- Optimised large-scale FreeBSD jails orchestration.

Khallagh Borhan

Software Engineer

full-time

Jan. 2016–May. 2021

- Built kernel-level network monitoring in C, achieving line-rate packet processing.
- Architected and delivered a public Platform-as-a-Service (PaaS) with custom Kubernetes cluster-management tooling.
- Improved a public video-streaming platform's performance by around 80% through infrastructure redesign and refactoring legacy Java code.
- Identified and resolved critical memory leaks in core services, reducing memory footprint by roughly 75%.
